The GA1031 Precision 3-Stub Tuner is a part of GAE's line of compact and light weight 915 MHz components designed for high power microwave heating applications. As a coaxial transmission line tuner, the GA1031 is ideal for load impedance matching in laboratory research and production process systems where traditional waveguide components are unsuitable due to their size and weight.

The stubs are spaced at 1/4 wavelength intervals to provide impedance matching over a broad range of mismatch conditions. A precision screw drive mechanism is provided on each tuning stub enabling highly accurate and repeatable tuning. The stub housings are designed with 1/4-wave reactive chokes allowing use in high power applications.

**General Specifications:**
- **Frequency**: 915 MHz +/- 15 MHz
- **Input Power**: 5 kW max.
- **Flange**: EIA 1-5/8 coax (fixed)
- **Impedance**: 50 Ohm (nominal)
- **Impedance Matching**: 3 stubs with 1/4-wave chokes on 1/4 wavelength spacing
- **Construction**: Aluminum outer conductor and flanges, copper center conductor
- **Finish**: Chemical conversion coating

All dimensions are in inches [millimeters].
